

CBX7[®] Low Voltage Control Unit

DATA SHEET

Description:

Heatizon Systems CBX Series control units house a step-down transformer and other components necessary to operate low voltage Heatizon products.

The CBX7 has been engineered specifically for snow melting applications. It powers Tuff Cable systems, providing consistent heat output which is

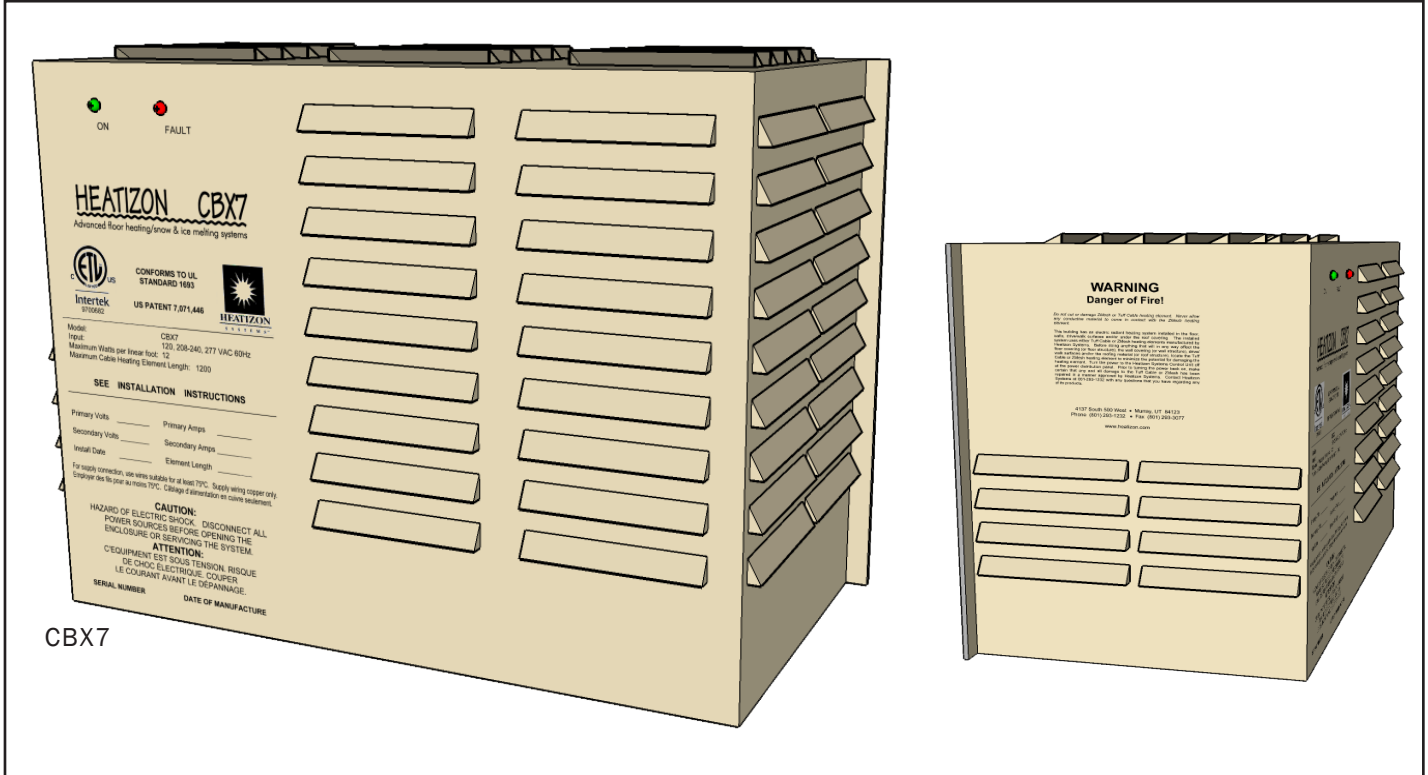

easily adjusted via the included potentiometer. The potentiometer is unique in that it allows the secondary amperage to be adjusted without changing the tap on the transformer.

The CBX7 is ideally suited for snow melting systems installed in new pour or retrofit into existing cement or asphalt,

as well as cables placed beneath pavers.

The control unit includes LEDs to indicate when the system is running or if the system has gone into a fault.

Design:

Models

CBX7	Designed specifically for snow melting
CBX7-277	CBX7 for 277 input power

Specifications:

Dimensions	17" w, 12" h, 9" d
Input Voltage	208V, 240V, 277V

Note: Refer to the NEC or CEC for specific requirements.
